Identifiers, Physical and Chemical properties

Substance

End Point : IDENTIFIERS, PHYSICAL AND CHEMICAL PROPERTIES
Chemical Name : Cyclohexanone
Common Name : Cyclohexanone
CAS Number : 108-94-1
RTECS Number : GW1050000

Synonyms

Anon
Cyclohexyl ketone
Hytrol O
Nadone
Pimelin ketone
Anone
Hexanon
Ketohexamethylene
Pimelic ketone
Sextone

Properties & Definitions

Molecular Formula : C6H10O
Molecular Weight : 98.14
Melting Point : -32.1°C
Boiling Point : 155.65°C
State : Liquid, oily
Flash Point : 63°C (c-cup)*
Flammable Limit : 1.1-9.4%; combustible
Density : 0.9478 at 20°C
Vapour Pressure : 0.67 kPa (5 mmHg) at 25°C
Octanol/Water Partition Coefficient : log Pow = 0.0805 calculated
Water Solubility : 23 g/L at 25°C
Solubility in other Solvents : Soluble in alcohol, ether, benzene and chloroform.
Odour : Reminiscent peppermint, acetone
Additives : None
General Comments : *For FP the value 44 (c-cup) is also reported. Composition of the feedstock is typically 38% cyclohexanone mixed with 44% adipic acid, 3-4% other materials (valeric acid, hexyl valerate, pentanol, hexyl formate, valeraldehyde, caproaldehyde) and water. Refractive index n20/D = 1.4507. Autoignition temperature = 420°C. Freezing point = -16.4°C. Vapour harmful.

Overall Evaluation

CURRENTLY OF LOW PRIORITY FOR FURTHER WORK

SIDS INITIAL ASSESSMENT

Cyclohexanone is used in organic synthesis, particularly in the production of adipic acid and caprolactam (ca. 95%), polyvinyl chloride and its copolymers, and methacrylate ester polymers. Additional uses include wood stains, paint and varnish removers, spot remover, degreasing of metals, polishes, levelling agents, dyeing and delustering silk, lubricating oil additives, solvent for herbicides, cellulosics, natural and synthetic resins, waxes, fats, etc.

For processes involving closed systems, occupational and consumer exposure is expected to be minimal. Air monitoring at sites using closed systems has detected 1.5E-3 and 0.16 ppm cyclohexanone; personal monitoring values range from 0.07 to 0.5 ppm. Those values are significantly less than the international exposure standard for cyclohexanone which is 25 ppm (time weighted average). It is expected that occupational and consumer exposure may occur when cyclohexanone is used as a solvent; however, details regarding levels of use and exposure have not been provided by other countries.
This material degrades rapidly by reaction with sunlight and is biodegradable in water. On soil surfaces and in water, cyclohexanone is expected to be eliminated by volatilization, photolysis, and biodegradation. Based on the low Koc, this material is considered to be highly mobile in soil. Fugacity level Ib environmental modeling indicates that cyclohexanone will partition almost exclusively to the air (31%) and water (69%). Level III modeling for southern Ontario, Canada, indicates that emission of cyclohexanone will result in the partition of this material into air (16.3%) and water (83.6%) and that the concentrations in soil and sediment will be very low. Concentrations in ambient air in the vicinity of a U.S. industrial site ranged from 22 to 158 ng/m3 (5.5E-6 to 3.9E-5 ppm). The low octanol/water coefficient suggests that cyclohexanone is unlikely to bioconcentrate in aquatic organisms; therefore, potential for secondary poisoning is low.

Experimentally, cyclohexanone has exhibited low acute toxicity towards freshwater fish species and the microcrustacean Daphnia magna, slight acute toxicity to algae and protozoa, and moderate acute toxicity to bacteria. QSAR-derived estimates of fish, daphnia, and algal acute toxicity compare favorably with those derived experimentally. Experimental data for chronic studies was not available. In addition, cyclohexanone meets the criteria of a Class I non-polar chemical; therefore, QSAR was used to estimate the NOECs for chronic toxicity in fish and daphnia.

This material exhibited low to slight acute toxicity by the oral and inhalation routes and was moderately toxic by the dermal route. It is an eye and skin irritant; however, it did not induce skin sensitization. Upon repeated administration to rats in drinking water, the NOAEL was 4700 ppm after 25 weeks and the LOAEL was 3300 ppm after 2 years. Effects at higher concentrations were primarily body weight decreases. The NOAEL in published repeated dose inhalation studies was 100-190 ppm. Those values were based on either gray mottling of the lungs or ocular irritation and degenerative changes in the liver and kidney at higher concentrations. However, the NOAEL in those studies was not confirmed in more conclusive and GLP inhalation studies for reproductive and developmental effects (NOAEL = 650-1000 ppm). The majority of the experimental evidence indicates that cyclohexanone is not genotoxic, and this material was not considered to be carcinogenic in mice or rats following two years of exposure via the drinking water. In a two-generation reproduction study, decreased fertility was observed in rats exposed via inhalation at 1400 ppm but not at 500 ppm; however, the effect was found to be reversible following a post-exposure recovery period. The NOAEL of 500 ppm for this reproductive effect is 1000 times greater than the highest occupational personal monitoring value (0.5 ppm) reported. Developmental studies indicate that fetal toxicity was present only at concentrations which were maternally toxic, and no malformations were detected. There has been no consistent indication that cyclohexanone causes neurotoxicity, although signs of CNS depression were noted at doses near the LD50. Therefore, this material could not be classified regarding its potential neurotoxicity to humans.

EXPOSURE

General Discussion: very little information was provided by the OECD National Authorities regarding production levels, percentages of use for various applications, emissions, or occupational exposure. It should be noted that differences in use patterns would result in different exposure scenarios.

EMISSIONS

Germany - Air = 2.5 t/y during production
  150 kg/year during processing and handling
  - Water = 6.4 t/y during production, processing, and handling (effluent from waste water treatment plants)
  - 1800-1900 t/y through plant protection products to air, water, and soil

Note: for a production site near the River Rhine, at low flow (10-percentile = 550 m3/s), a PEC value of 0.3 µg/L was calculated for an emission level of 6.4 t/y.

Sweden - almost 100% recovered or destroyed

ENVIRONMENTAL EXPOSURE

Biodegradability:

Cyclohexanone has been shown to biodegrade in natural water

Theoretical biological oxygen demand (BOD) = 2.61 mg O2/mg
Measured BOD after 20 days = 57% of theoretical BOD
Hydrolysis:

No information was available regarding the hydrolysis of cyclohexanone. In water, the important environmental fate processes are expected to be biodegradation, photolysis, and volatilization.

Photolysis:

In air cyclohexanone degrades rapidly by reaction with sunlight (t1/2 ca. 1 day) and by direct photolysis (t1/2 ca. 4.3 days). Since cyclohexanone photolyses in ambient air, direct photolysis in water and on soil surfaces is expected to occur.

Volatilization:

Based on vapor pressure (5 mmHg at 25°C), cyclohexanone should exist almost entirely in the vapor phase (Henry's law constant = 1.2 x 10E-5 atm.m3/mol). Volatilization from shallow, rapidly moving water should be significant (t1/2 ca. 3.1 days). Volatilization from soil is also expected.

Sorption:

The calculated log10Koc for cyclohexanone is 1.823. This low value indicates that cyclohexanone is highly mobile in soil.

Environmental Fate Modeling:

The MacKay level IIA fugacity calculation indicates that approximately 69% of total cyclohexanone in the evaluative environment will partition into water and 31% into air. This is consistent with the moderate water solubility (23 g/L at 25°C) and vapor pressure (5 mmHg at 25°C) of this material. The MacKay Level III fugacity calculation for southern Ontario, Canada, indicates that emission of cyclohexanone will result in the partitioning of this material into air (16.3%) and water (83.6%) primarily and that the concentrations in soil and sediment will be very low.

Bioaccumulation:

The low Kow value (0.805) indicates that cyclohexanone is unlikely to bioconcentrate in aquatic organisms; therefore the potential for secondary poisoning is low.

Monitoring Data:

Concentrations measured in ambient air in the vicinity of the American Cyanamid Corporation site in the U.S. were from 22 to 158 ng/m3 (5.5E-6 to 3.9E-5 ppm). (Reference: Pellizari, E.D. Quantitation Chlorinated Hydrocarbons in Previously Collected Air Samples. EPA-450/3-78-112)

CONSUMER EXPOSURE

For DuPont Canada, no consumer exposure is expected to occur when the raw material is used in a closed system. For other countries, no information was provided regarding exposure during agricultural and solvent applications.

OCCUPATIONAL EXPOSURE

For DuPont Canada and DuPont US processes involving closed systems, occupational exposure is essentially zero. For other countries, no specific information was provided when cyclohexanone is utilized as a solvent or in agricultural formulations.

Monitoring Data:

Canada - For DuPont, personal monitoring = 0.07 - 0.5 ppm; air = 0.16 ppm
(0.5 ppm = ca. 0.3 mg/kg/day in humans assuming 100% absorption by a 70 kg man breathing 10 m3/8 hours and 1 ppm = 4.01 mg/m3)

Sweden - < 25 ppm (25 ppm = ca. 14 mg/kg/day in humans)

Italy - Indoor air 6 ug/m3 (1.5E-3 ppm)
Identifiers, Physical and Chemical properties

Exposure Standards:

25 ppm TWA with skin notation (ACGIH TLV, OSHA PEL, Ontario TWAEV, Swedish TLV)

(25 ppm = ca. 14 mg/kg/day in humans)

CALCULATION OF MAXIMUM TOLERABLE CONCENTRATION (MTC):

Experimentally, cyclohexanone exhibited low acute toxicity towards freshwater fish species and the microcrustacean Daphnia magna. Applying an assessment factor of 100 to the lowest experimentally- or QSAR-derived LC50 or EC50 value for an algal, daphnid, or fish species, the MTC = 527 mg/L/100 or 5.3 mg/L.

No experimentally-derived chronic data for fish or daphnids are available. Since cyclohexanone meets the criteria of Class I non-polar narcotic chemicals and acute baseline toxicity values compared favorably with the experimental values for fathead minnow and daphnid (QSAR/experimental ca. 1.3), the appropriate QSAR.1 was used to estimate the NOECs for chronic toxicity. The QSAR-derived NOECs for Ps. putida and Microcystis were approximately eight and six times greater, respectively, than the NOECs calculated from the experimental threshold toxicity (TT) values (NOECs for bacterial and algal growth inhibition were calculated by dividing the TT, assumed to be synonymous with the LOEC, by 2). Applying an assessment factor of 10 to the lowest NOEC value, the MTC = 26/10 = 2.6 mg/L.

The potential for chronic exposure to cyclohexanone in the aquatic environment is greatest in situations where losses through biotic and abiotic degradative pathways are impeded such as in ground waters and in deep and/or slow-moving water bodies. The estimated MTC value is greater than 2 orders of magnitude less than the NOECs for growth and reproduction for D. Magna and En. sucatum, two of the species tested that represent organisms which commonly inhabit slow-moving or static waters. A MTC of 2.6 mg/L for cyclohexanone should be adequate to safeguard against long-term effects.

CONCLUSION AND RECOMMENDATIONS

Based on the breadth of the present data base for human health and aquatic toxicity effects, no additional testing is required for cyclohexanone. For processes involving closed systems, this material should be placed in the category of low concern; however, international information on exposure is needed to assess the significance of solvent and agricultural applications and to develop exposure scenarios specific to other uses identified.

Cyclohexanone

Geographic Area: CAN

Quantity: 60%

Comments:
For others (producers excluding Du Pont), sixty percent of imported quantities is used as a solvent in herbicides. Application rate is estimated to be 200 mL/hectare. However, cyclohexanone is being replaced by other solvents; therefore its use in this application is expected to be reduced. The remainder is for undetermined uses.

For Du Pont, cyclohexanone is produced and further processed in a closed system as an intermediate in the production of adipic acid.

Partitioning of cyclohexanone into sediment (emission was 0%)
Partitioning of cyclohexanone into soil (emission was 0%)
Partitioning of cyclohexanone into water (emissions mol/ hour = 17.45)
Partitioning of cyclohexanone into air (emissions mol/ hour = 17.45)

It was estimated that 30 tonnes/year of cyclohexanone were released in the proportions listed above.

**General Comments**: There are no "real" data on the environmental concentration and behaviour of cyclohexanone in the environment. This has necessitated the use of the Level III fugacity model of MacKay and Paterson (1991). The fugacity model for the region of southern Ontario accepts as input the following: the physical chemical properties of the chemical, its transformation half-lives and emission rates into the environmental media of air, water, soil, and sediment. It then calculates the prevailing steady state concentrations and the amounts and rates of degradation, advective flow, and intermedia transport. The concepts underlying this modelling approach are described in the text by MacKay (Multimedia Environmental models: The Fugacity Approach 1991).

</tbody>
</table>

The MacKay Level Ib fugacity calculation indicates that approximately 69% of the total (cyclohexanone in the evaluative environment will partition into water compartment).

Cyclohexanone which will partition into air (calculation as above). Both values (69 and 31%) are consistent with the moderate water solubilities and vapour pressure for cyclohexanone.

General Comments: A level Ib fugacity calculation was conducted to estimate the partitioning of cyclohexanone in the environment. This calculation simply estimates the equilibrated distribution of a substance in various compartments in an evaluative environment and does not address degradation pathways. It may be useful in identifying key environmental compartments to which a substance will partition.

Species/strain/system : Du Pont (Canada) personal air monitoring at Maitland site

Test Method and Conditions

Test method description : Monitoring study
Test Results

**Intake**                  | **Spec.** | **Date** |
---                        | ---       | ---      |
0.07-0.5 ppm              |           |          |
Typical levels found by personal air monitoring at Maitland site, Du Pont.

0.16 ppm                  |           |          |
The level yielded by area air monitoring.

**General Comments**       : Consumer Exposure: for Du Pont, Canada, no consumer exposure is expected to occur when the raw material is used in a closed system. Occupational Exposure: for processes involving closed systems, occupational exposure is essentially zero.

Test Method and Conditions

Test method description : Biological screening studies

Test Results

General Comments : In water, one important environmental process for cyclohexanone appears to be biodegradation. Biological screening studies have found that cyclohexanone is biodegradable in various test systems, including natural water; this suggests that biodegradation in soil is possible.

References

Primary Reference : HBEFE*
Handbook of Environmental Fate and Exposure Data for Organic Chemicals, 129-134, (1991)

<td>By direct photolysis (half-life of about 4.3 days).</td>
</tr>
</tbody>
</table>

**General Comments**: In water, one important environmental fate process for cyclohexanone appears to be photolysis. Since it photolyses in ambient air, direct photolysis in water and on soil surfaces is expected to occur; however, the photolysis rate in water will be slower. The following reference is also cited: Syracuse Research Corporation (Hazardous Substances Database).

<tbody>
<tr>
<td>50 %</td>
<td>3.1 d</td>
<td>Volatilization from shallow, rapidly moving water should be significant (estimated half-life of 3.1 days for model stream 1 m deep). However, volatilization from deeper, less rapidly moving bodies of water, such as lakes and ponds, will be much slower. Volatilization from soil is also expected. Volatilization will occur on soil surface. In water, one important environmental fate process for cyclohexanone appears to be volatilization. Based on vapour pressure (5 mmHg at 25°C), cyclohexanone should exist almost entirely in the vapour phase (Henry's law constant = 1.2E-5 atm. m3. mol) in the ambient atmosphere. The following reference is also cited: Syracuse Research Corporation (Hazardous Substances Database).</td>

General Comments: At 475 mg/kg to 950 mg/kg, rats only showed increased weight gain, no deaths. At 1900 or 3800 mg/kg, 4/5 or 5/5 rats died. Hemorrhage of lungs, congestion throughout abdominal viscera, and mottled liver were observed in gross pathology.

Test Method and Conditions

Test method description : GLP: no data

Exposure

Dose / Concentration : 16057 mg/m3 AIR
Test Results

Guinea pigs exposed to 4000 ppm (16057 mg/m3) for 10 minutes exhibited marked tearing and squinting. A 6-hour exposure caused narcosis, lacrimation, salivation, hypothermia, decreased respiratory and heart rates and opacity of the corneas. Recovery from narcosis was very slow.

Test Method and Conditions

Test method description : The human sensory-irritation threshold for cyclohexanone was determined.
General Comments : The human sensory-irritation threshold for cyclohexanone: data showed nasal irritation at 0.28 mg/L of air (about 70 ppm). Eye, nasal, and throat irritations were seconded at 0.362 mg/L of air (about 90 ppm). The second exposure 2 weeks after the initial series indicated an increase in the sensory irritation threshold. In this series, at 0.547 mg/L of air (about 136 ppm), throat irritation was the only response recovered.

Test Method and Conditions

*Test method description* :
Concentrations of 184, 255, 282, 334, or 577 ppm cyclohexanone were used. GLP: no data

Exposure

*Exposure Period* :
4 h

*Dose / Concentration* :
738-2316 mg/m3 AIR

*General Comments* :
Mice exposed to 184, 255, 282, 334, or 577 ppm for 4 hours decreased their duration of immobility in a behavioral despoint swimming test when measured over 3 minutes by 20, 36, 47, 61 and 81%, respectively. LD50 (mean active atmospheric concentration associated with 50% decrease in immobility) was 308 ppm. A concentration of 184 ppm or higher resulted in CNS effects.

Mammalian Toxicity

Test Method and Conditions

- **Test method description:** GLP: no data

Exposure

- **Dose / Concentration:** 0.2 mL
- **Exposure comments:** Aspiration of cyclohexanone (0.2 mL).

Test Results

When 0.2 mL cyclohexanone was aspirated, rats died. Cause was attributed to respiratory arrest or cardiac failure or both, rather than pulmonary edema, as indicated by rapid cessation of respiratory or cardiac action after dosing, lung weights and the macroscopic appearance of the lungs.

Exposure

- **Exposure Period:** 6 h
- **Dose / Concentration:** 15480 mg/m3 AIR

Test Results

Rats exposed to 15.48 mg/L of cyclohexanone in air for 6 hours showed no gross tissue changes attributable to the test compound after a 14-day observation period.

One dog died after 8 injections of 284 mg/kg; the death appeared to be the result of respiratory depression.

CNS FUNCT
Clinical signs of CNS toxicity were observed.

RBC STRUC
BMW STRUC
SPLN STRUC

Erythroid hyperplasia was the most significant finding in dogs. The bone marrow effects were accomplished by extramedullary hematopoiesis in the spleen.

Regimen I produced metabolic acidosis with an apparent respiratory component.

RBC        DECR
BMW        STRUC

Hemolysis
Bone marrow hyperplasia

General Comments: The severity of the responses correlated well with maximal plasma concentrations obtained and conditions of administration as follows I > II > III > IV. This distinction was more apparent with repeated administration and affected prognosis for recovery. The concentration administered was more critical than the rate of injection in producing localized tissue inflammation at the injection sites, hemolysis, secondary responses, bone marrow hyperplasia and extramedullary hematopoiesis. The rate of administration was important since at either concentration used, the group that received the compound at the faster rate had a greater response.

No statistically significant differences in occurrence/ development of cataracts between treated and salined group (7/11 animals affected in each group; the frequency for untreated animals was 20/93).

NEF
Cyclohexanone treatment produced no effect on growth or behavior during the treatment period.

General Comments: Authors concluded that cataracts observed were an inherent characteristic of the guinea pigs, making the animal an unsuitable model for the assessment of cataractogenic potential.

<td></td>
</tr>
</tbody>
</table>

Inhalation LCLo for mice amounted 19200 mg/m3/90 minutes.

**General Comments**: Mice exposed to 19200 mg/m3 died within 90.9 minutes (mean). Histological examination showed acute congestion and edema of the lungs, focal to diffuse hemorrhage of the lung parenchyma, and hyperplasia in the spleen.

</tbody>
</table>
34000 ppm was lethal to 1/10 male mice.

At treatment levels less than 47000 ppm, pathological changes were minimal.

LOAEL

LOAEL was determined to be 25000 ppm in females and 13000 ppm in males, based on weight gain data.

4-hour Acute Lethal Concentration (ALC) for rats was established as 8020 mg/m³ (2000 ppm).

General Comments : Rats exposed to a concentrated vapor of cyclohexanone died within 30 minutes. 1/6 rats exposed to 2000 ppm for 4 hours died; survivors were anesthetized within 2.5 hours. 6/6 rats exposed to 4000 ppm for 4 hours died. Gross pathology of non-survivors showed dark red color in liver, kidneys, and blood.

After 3 weeks exposure, deodorized air reduced spine density on medial and lateral side of bulb; cyclohexanone decreased spine density on lateral side only. Reductions were evident in other animals at 7 weeks exposure.

With all treatments spine density was maximal at postnatal day 21 and decreased markedly during the next month.

Growth and overt behavior normal.

SENSE CHNG
Adult rats had significantly smaller mitral cells than controls.

General Comments: Authors suggest that exposure to single predominant odor has two effects: it directly deprives many mitral cells of excitation, and (via intraneurons) it reduces activity in others by inhibiting their excitatory afferents.

Lowest Lethal Dose (ALD) for rabbits was referred as 1600 mg/kg body weight.

General Comments: At 900-1600 mg/kg narcosis was seen. Doses from 10000 - 19000 mg/kg were fatal to 3 rabbits in 18-39 hours. Pathology of dead animals showed damage to lungs, hepatic cirrhosis, and nephritis. Widespread blood vessel damage occurred in heart muscle, liver, spleen, and kidneys; and severe damage occurred in lungs.

LDLo was 10200 mg/kg.

General Comments: Rabbits died when exposed to a few applications of undiluted cyclohexanone (10200-23000 mg/kg). Results ranged from slight anesthesia to marked hypothermia, convulsions, narcosis and death.

Animals at 3082 ppm lost weight, showed decreased body temperature and incoordination.

DEATH
At 3082 ppm 50% mortality was observed.

EAR | CIRC
GIT | EXOC
EYE | IRRIT
At 3082 and 1414 ppm, rabbits had distended ear veins, excess salivation, and conjunctival irritation throughout, the daily exposures.

EYE | IRRIT
Less ocular irritation was observed in 309 ppm and 773 ppm groups.

NEF
Exposure at 190 ppm for 300 hours produced no behavioral changes and induced barely demonstrable degenerative changes in livers and kidneys.

NOAEL
NOAEL = 190 ppm (762 mg/m3)

</tbody>
</table>

LOAEL -
NOAEL = 6500 ppm.

General Comments : Lack of a dose response for increased numbers of tumours already having a high background incidence prompted the authors to conclude that evidence of carcinogenicity was marginal and the effects, if any, were weak.

</tbody>
</table>

No marked effects on survival were observed.

BW RETAR
A dose-related decrease in weight gain was evident in both male and female rats.

Many neoplasms were seen in the treated animals; however, few neoplasms differed in incidences from the controls.

ADREN NEO M
Only adenoma of the adrenal cortex in males at 3300 ppm occured a statistically higher incidence than the controls. In the absence of a dose response, it is doubtful that this was a carcinogenic effect.

LOAEL
LOAEL = 3300 ppm (based on ca. 13% decrease in body weight).

General Comments: Lack of a dose response for increased numbers of tumors already having a high background incidence prompted the authors to conclude that evidence of carcinogenicity was marginal and the effects, if any, were weak.

Study

End Point : NEUROTOXICITY
Chemical Name : Cyclohexanone
CAS Number : 108-94-1

Evaluations

Evaluation text : The neurotoxicity of cyclohexanone has been examined in several animals species (rats, dogs, mice, guinea pigs). However, there has been no consistent indication of specific neurotoxic effects. At highest doses near the LD50, signs of CNS depression occurred. Behavioral changes may be due to general anesthetic effects of cyclohexanone. On the basis of the existing data, this material could not be classified as having potential neurotoxicity to humans. (Criteria Document for Evaluation of Existing Data, Nordic Council of Ministers and National Institute of Occupational Health, Denmark, 1992).

Exposure

Exposure Type : ACUTE
Dose / Concentration : 0.1 mL
0.1 mL of undiluted cyclohexanone produced generalized moderate but penetrating corneal injury, mild iritis, and conjunctivitis in rabbit eyes. Corneal injury was reversible in all treated eyes. 14 days after dosing, the treated unwashed eyes showed generally mild corneal damage, washing the treated eyes 20 seconds after exposure did reduce ocular effects somewhat, but the eyes still showed very mild to microscopic corneal changes at 14 days.

Cyclohexanone was severely irritating to rabbits skin at doses of 200 and 794 mg/kg.

Pale red erythema and moderate edema were observed after 24 hours at 200 mg/kg dose; second-degree burns, focal escharosis and mild desquamation at day 7 and focal escharosis and mild desquamation at day 14 were observed.

At 794 mg/kg dose pale red to red well-defined erythema, severe edema, subdermal hemorrhaging, and focal second- and third-degree burns were observed at 24 hours and escharosis and moderate desquamation at days 7 and 14.

General Comments: Necropsy showed gastroenteritis and hemorrhaging in the colon of 1 rabbit dosed with 200 mg/kg; red lungs in 2 rabbits at 794 mg/kg; and focal discoloration of the liver and red lungs in 2 rabbits in the high dose. 4/4 rabbits died when dosed with 3160 mg/kg.

No effect on maternal mortality. Statistical differences between treated and controls for mean body weights and mean weight gains.

NEF

No effect on pregnancy data, and mean number of viable fetuses/pregnant female.

FETUS SIZE

Fetuses exhibited a significant decrease in mean body weight. No external malformations were reported.

FETUS STRUC

The incidence of visceral malformations was significantly greater in the treated group compared to control; however, treatment-related effect was not indicated based on the nature of the malformations. The incidence of skeletal malformations was comparable between controls and treated animals.

LOAEL

LOAEL for Maternal Toxicity: 1400 ppm; LOAEL for Fetal Toxicity: 1400 ppm; LOAEL for Fetal Malformations >1400 ppm (no malformations).

Exposure

**Exposure Type**: SHORT  
**Exposure Period**: 5-20 TDP  
**Frequency**: 7 h  
**Dose / Concentration**: 400-2000 mg/m³ AIR  
**Exposure comments**: Inhalation exposure to 100, 250 or 500 ppm on days 5-20 of pregnancy.

Test Results

Maternal weight gain at 250 and 500 ppm was only slightly lower than control. Gray mottling of the lung was seen in a few of the cyclohexanone-exposed dams.

No significant differences between the treated and control groups in fetal weight, resorption sites, fetal death or sex ratio.

External and soft-tissue examinations revealed no significant incidence of malformations or variations in the treated animals.

A slight increase in the mean percent of rudimentary ribs/litter was seen in the 250 and 500 ppm groups. However, no significant numbers of skeletal malformations were noted.

**NEF**

No adverse treatment-effect on maternal gross post-mortem observations.

Mean body weight data during gestation in the 800 and 1600 ppm groups were lower than controls on days 15 and 20. Lacrimation was noted with increased frequency in the 1600 ppm group; miosis was seen in 2 dams at 1600 ppm.

**NEF**

No adverse treatment-effect was noted on mortality, corpora lutea, uterine implantation data.

**FETUS** **NEF**

No adverse treatment-effect on fetal sex distribution data or fetal external examination data.

**FETUS** **SIZE**

Mean fetal weight data was lower than controls at 1600 ppm.

Test Method and Conditions

**Test method description**: GLP: yes
Exposure

Exposure Type : SHORT
Exposure Period : 6-19 TDP
Frequency : 6 h/d
Dose / Concentration : 1204-5620 mg/m³ AIR
Exposure comments : Whole-body inhalation exposure to groups of animals at nominal concentrations of 0, 300, 650, or 1400 ppm cyclohexanone on gestation days 6-19.

Test Results

No effect on maternal mortality. Maternal body weight and body weight gain in the high-dose group were statistically different from control.

NEF
No effect on pregnancy rate and uterine implantation data.

FETUS SIZE FETUS STRUC
Fetuses derived from the high-dose group exhibited significantly lower body weights. At 1400 ppm, the incidence of fetuses with at least one ossification variation was increased.

FETUS NEF
No increases in external, visceral, or skeletal malformations occurred at any concentration.

NOAEL
NOAEL for Maternal Toxicity: 650 ppm; NOAEL for Fetal Toxicity: 650 ppm; NOAEL for Fetal Malformations: 1400 ppm (no malformations).

**Reported Name:** CYCLOHEXANONE

**CAS Number:** 108-94-1
These rules define the responsibilities of occupiers of any industrial activity in which toxic and hazardous substances may be involved. These responsibilities encompass:

1. Assessment of major hazards (causes, occurrence, frequency).
2. Measures to prevent accidents and limit eventual impairment to human health and pollution of the environment.
3. Provision of relevant factual knowledge and skills to workers in order to ensure health and environmental safety when handling equipment and the foregoing chemical.
4. Notification of the competent authorities in case of major accidents.
5. Notification of sites to the competent authorities 3 months before commencing.
6. Preparation of an on-site emergency plan as to how major accidents should be coped with.
7. Provision of competent authorities with information and means to respond quickly and efficiently to any off-site emergency.
8. Provision of information to persons outside the site, liable to be affected by a major accident.
9. Labelling of containers as to clearly identify contents, manufacturers, physical, chemical and toxicological data.
10. Preparation of a safety data sheet including any significant information regarding hazard of this substance.
11. For the import of a hazardous chemical to India, importers must supply the competent authorities with specified information regarding the shipment.

Summary - The following chemical is included on a list of chemicals and mixtures for which reporting is currently required under the Toxic Substances Control Act Section 2607A. This toxic substance is subject to Preliminary Assessment Information Rules on product ion quantities, uses, exposures, and adverse effects. Manufacturers including importers must submit a report for this listed chemical manufactured at each site.

### USA REG - IGNITABLE

**Description:** THIS CHEMICAL, IF DISCARDED, MUST BE TREATED AS AN ACUTE HAZARDOUS WASTE. ACUTE HAZARDOUS WASTES REGULATIONS ARE MORE RESTRICTIVE FOR EXCLUSION. ANY RESIDUE OF THIS CHEMICAL LABELED AS ACUTELY HAZARDOUS AND REMAINING IN A CONTAINER, OR AN INNER LINE REMOVED FROM A CONTAINER, IS CONSIDERED A HAZARDOUS WASTE IF DISCARDED UNLESS TRIPLE RINSING OR OTHER CLEANING MEASURES ARE TAKEN (40 CFR 261.33E).

**Title:** RCRA-RESOURCE AND CONSERVATION RECOVERY ACT: DISCARDED COMMERCIAL CHEMICAL PRODUCTS, OFF-SPECIFICATION SPECIES, CONTAINER RESIDUES, AND SPILL RESIDUES THEREOF.
