**CONCLUSIONS AND RECOMMENDATIONS**

It is currently considered of low potential risk and low priority for further work.

**SHORT SUMMARY WHICH SUPPORTS THE REASONS FOR THE CONCLUSIONS AND RECOMMENDATIONS**

The production volume of Indigo Blue was ca. 1,200 tonnes/year in 1990 - 1992 in Japan. This chemical is used in dyeing industry as a direct dye or as an intermediate for the synthesis of other dyes. This chemical is considered as “not readily biodegradable”.

PECs have been calculated based on several models considering its physico-chemical properties (e.g. molecular weight, water solubility, vapour pressure and partition coefficient). The worst estimated concentrations were $7.7 \times 10^{-12}$ mg/l (air), $2.6 \times 10^{-4}$ mg/l (water), $5.1 \times 10^{-4}$ mg/kg (soil), $2.2 \times 10^{-2}$ mg/kg (sediment).

For the environment, various NOEC and LC$_{50}$ values were gained from test results; LC$_{50} > 1000$ mg/l (acute fish); EC$_{50} = 250$ mg/l (acute daphnia); EC$_{50} = 6.5$ mg/l (acute algae); NOEC = 0.78 mg/l (long-term daphnia reproduction). Therefore, the chemical is considered to be moderately toxic to daphnids and algae. The lowest chronic toxicity result, 21 d-NOEC (reproduction) of *Daphnia magna* (0.78 mg/l), was adopted for the calculation of PNEC, applying an assessment factor of 10. Thus the PNEC for the chemical is 0.0078 mg/l. Since the PEC is lower than the PNEC, environmental risk is presumably low.

Based on the physico-chemical properties, the level exposed indirectly through the environment was estimated to be $1.9 \times 10^{-3}$ mg/man/day (i.e. $3.2 \times 10^{-4}$ mg/kg/day). Also, the daily intake through drinking water is estimated to be $8.7 \times 10^{-6}$ mg/kg/day and through fish is calculated to be $2.2 \times 10^{-5}$ mg/kg/day. No data on occupational exposure are available. Neither monitoring data at work place nor data on consumer exposure have been reported.

Although the chemical showed no genotoxic effects in bacteria, a positive result was obtained from a chromosomal aberration test *in vitro*. However, in a micronucleus test *in vivo* that was performed to confirm the mutagenicity of the chemical, the result was negative.

In a 2-year feed study in rats, there were no serious effects related to the test substances up to the highest dose level (3% feed i.e. approx 1200 mg/kg/day). In a 3-generation reproductive toxicity study at doses of 5, 50, 150, or 500 mg/kg/day in rats, there were also no effects observed such as reproduction performance, maternal weight gain and fetal development. Therefore, the NOEL was 1,200 mg/kg/day for repeated dose toxicity as well as 500 mg/kg/day for reproductive toxicity.

For human health, estimated dose of low concern (EDLC) was calculated as 12 mg/kg/day and 5 mg/kg/day for repeated dose and reproductive toxicity, respectively, using a safety factor of 100. Daily intake of the chemical was estimated as $3.2 \times 10^{-3}$ mg/kg/day from an exposure model. Also, the daily intake through drinking water is estimated to be $8.7 \times 10^{-6}$ mg/kg/day and through fish is calculated to be $2.2 \times 10^{-5}$ mg/kg/day. The EDLC is quite larger than the estimated human exposure, and the margin of safety is very large. Therefore, health risk through the environment, in general, is considered to be presumably low due to its use pattern and exposure situation.
In conclusion, no further testing is needed at present considering its toxicity and exposure levels.

2 GENERAL INFORMATION ON EXPOSURE

Indigo Blue is a stable solid, and the production volume is ca. 1,200 tonnes/year in 1990 – 1992 in Japan. This chemical is used in dyeing industry as a direct dye or as an intermediate for the synthesis of other dyes. Indigo Blue seems to be released into water from its production sites after biological treatment. No specific monitoring data of the chemical are available. This chemical is stable in neutral, acidic or alkaline solutions, and is classified as "not readily biodegradable".

2.1 Environmental Exposure and Fate

2.1.1 Photodegradation

The half-life time of 0.112 years is estimated for the degradation of Indigo Blue in water by direct photodegradation. (MITI, Japan).

2.1.2 Stability in Water

The chemical is stable in water at pH 4, 7 and 9 (OECD TG 111). Half-life at pH 4 is 622 days at 25 °C

2.1.3 Biodegradation

If released into water, this substance is not readily biodegraded (MITI (l), corresponding to the OECD TG 301C: 0 % during 28 days based on BOD).

2.1.4 Bioaccumulation

BCF= 2.5 – 4.5 in carp (6 weeks at 25 °C) suggests that the potential for bioconcentration in aquatic organisms is low.

2.1.5 Estimates of environmental fate, pathway and concentration

Global situation

Method: MNSEM 147S

Input data: Molecular weight: 262.27
Water solubility: 7.50 [mg/l]
Vapor pressure: 3.0E-07 [mmHg]
Log Pow: 2.70

Results: Steady state mass and concentration

Air: 7.7E-12 [mg/l]
Water: 2.6E-04 [mg/l]
Soil: 5.1E-04 [mg/kg dry solid]
Sediment: 2.2E-02 [mg/kg dry solid]
Environmental exposure dose (Concentration in foods)
Inhalation of air: 1.4E-07 [mg/day]
Drinking water: 5.2E-04 [mg/day] (i.e. 8.6E-6 mg/kg/day)
Ingestion of fish: 1.3E-03 [mg/day] (i.e. 2.2E-6 mg/kg/day)
meat: 3.7E-09 [mg/day]
milk: 4.5E-09 [mg/day]
vegetation: 4.1E-05 [mg/day]
Total exposure dose: 1.9E-03 [mg/day] (i.e. 3.2E-5 mg/kg/day)

2.2 Human Exposure

2.2.1 Occupational Exposure
No data on work place monitoring have been reported.

2.2.2 Consumer Exposure
No data on consumer exposure are available.
3 HUMAN HEALTH HAZARDS

3.1 Effects on Human Health

3.1.1 Acute Toxicity

The LD\textsubscript{50} in an acute oral toxicity study in rats was reported as > 5,000 mg/kg. LC\textsubscript{50} and LD\textsubscript{50} values in acute inhalation and dermal toxicity studies in rats and rabbit are 5.3 mg/L/4 hrs and > 2,000 mg/kg, respectively.

Indigo Blue is not irritating to rabbit skin and eyes, and not sensitizing to humans.

3.1.2 Repeated Dose Toxicity

There is a 2 year oral repeated dose toxicity study in rats of Indigo Blue (Feber, K.H. 1987). Male and female F344/N rats were orally administered (feeding) at doses of 0, 0.25, 1.0 or 3.0\% (0, 100, 400, 1,200 mg/kg/day) for 2 years. Appearance and behavior of the test rats were generally comparable to those of the controls. At the 3\% level, food consumption was significantly lower than in the controls for the first six months but comparable to controls during the remainder of the study. No significant difference on survival rates was noted. Significantly lower hematocrit and hemoglobin values in comparison with controls were obtained at all time intervals except 24 months for the males fed 3\%. No such effect was noted in the females. Bilirubinuria was observed at 24 months in male and female at 1\% and females at 3\%. The test animals sacrificed at 52 weeks did not present any gross changes in the organs or viscera attributable to the test material. Autopsies performed on the animals which died during the second year of the study did not reveal any consistent gross changes. Microscopic findings at two years revealed no compound related effects on the kidneys or other tissues in either sex. The study appeared to demonstrate that after a period of adjustment to the higher dosage levels, the rats were able to tolerate up to of this substance in their diets without serious effects. NOEL for repeated dose toxicity is considered to be 1,200 mg/kg/day.

3.1.3 Mutagenicity

In vitro Studies

Bacterial test

In the reverse gene mutation assay, Indigo Blue showed negative results in \textit{Salmonella typhimurium} TA100, TA1535, TA98, TA1537 with or without a metabolic activation system (Muzzall, J.M. & Cook, WL., 1979).

Non-bacterial test

A chromosomal aberration test in line with Guidelines for Screening Mutagenicity Testing of Chemicals (Japan) and OECD Test Guideline 473 was conducted using cultured Chinese Hamster lung (CHL/IU) cells. This study was well controlled and regarded as a key study. The maximum concentration of the chemical was used within no apparent cytotoxic effect in continuous treatment. In short term treatment, it was set to 2.5 mg/ml. Positive results were obtained with and without metabolic activation (MHW, 1994).
In vivo Studies

In a micronucleus test in mice at concentrations of 0, 0.1, 0.5, 1.0, 2.0 mg/kg, Indigo Blue showed negative results.

3.1.4 Toxicity for Reproduction

In a three-generation reproductive toxicity study at doses of 5, 50, 150 or 500 mg/kg/day in rats (Harlan-Wistar), there were also no effects observed such as reproduction performance, maternal weight gain and fetal development. Therefore, the NOEL is considered to be 500 mg/kg/day for reproductive toxicity. Also, an oral developmental toxicity study in CD rat at doses of 0, 50, 160, 500 mg/kg/day administered from day 6 through day 15 of gestation was carried out. On the basis of number of viable and dead fetuses, resorption site, mean fetal weight, sex distribution, mean litter size, frequency of anomalies or weight gain of pregnant females, Indigo Blue was without effect on reproduction performance, maternal weight gain and fetal development. The NOEL is considered to be 500 mg/kg/day for reproductive toxicity.

3.2 Initial Assessment for Human Health

Although the chemical showed no genotoxic effects in bacteria, positive result was obtained from chromosomal aberration test in vitro. However, in a micronucleus test in vivo that was performed to confirm the mutagenicity of the chemical, the results were negative.

In a 2-year feed study in rat, there were no serious effects related to the test substances up to the highest dose level (3% feed i.e. approx. 1200 mg/kg/day). In a 3 generation reproductive toxicity study at doses of 5, 50, 150, or 500 mg/kg/day in rat, there were also no effects observed such as reproduction performance, maternal weight gain and fetal development. Therefore, the NOEL was 1,200 mg/kg/day for repeated dose toxicity as well as 500 mg/kg/day for reproductive toxicity. Also, an oral developmental toxicity study in CD rat at doses of 0, 50, 160, 500 mg/kg/day administered from day 6 through day 15 of gestation was carried out. Indigo Blue showed no effects on reproduction performance, maternal weight gain and fetal development. The NOEL is considered to be 500 mg/kg/day for developmental toxicity.

For human health, daily intake of the chemical was estimated as $1.9 \times 10^{-3}$ mg/man/day (i.e. $3.2 \times 10^{-5}$ mg/kg/day) from an exposure model. Also, the daily intake through drinking water is estimated as $8.7 \times 10^{-6}$ mg/kg/day and through fish is calculated as $2.2 \times 10^{-5}$ mg/kg/day. The margin of safety is very large. Therefore, health risk through the environment, in general, is considered to be presumably low due to its use pattern and exposure situation.
4 HAZARDS TO THE ENVIRONMENT

4.1 Aquatic Effects

Indigo Blue has been tested in a limited number of aquatic species (\textit{Selenastrum capricornutum}, \textit{Daphnia magna} and \textit{Oryzias latipes}), under OECD test guidelines [OECD TG 201, 202 and 203]. Acute and chronic toxicity data to test organisms for the chemical are summarized in Table 2. No other ecotoxicological data are available. Various NOEC and LC\textsubscript{50} values were gained from above tests; 96h LC\textsubscript{50} $> 1,000$ mg/l (acute fish); 24h EC\textsubscript{50} = 250 mg/l (acute daphnia); 72h EC\textsubscript{50} = 6.5 mg/l (acute algae, biomass method); 72h NOEC = 3.1 mg/l (algae, biomass method); NOEC = 0.78 mg/l (long-term daphnia reproduction). These toxicities except the NOEC for daphnid reproduction were above the water solubility limit (0.99mg/l) of this chemicals, and it should be noted that the vehicle concentration of the control was as high as 1000 mg/l (DMSO:HCO\textsubscript{4}0=9:1) in the daphnid reproduction test from which the lowest NOEC was driven. Therefore, the chemical is considered to be moderately toxic to daphnids and algae and non-toxic to fish. The lowest chronic toxicity result was the 21 d-NOEC (reproduction) for Daphnia magna (0.78 mg/l). An assessment factor of 100 is applied. Thus the PNEC of Indigo Blue is 0.0078 mg/l. Since the PEC is lower than the PNEC, the environmental risk is presumably low.

\hline
\end{tabular}
\caption{Acute and chronic toxicity data of Indigo Blue to aquatic organisms.}
\end{table}

Notes: \textsuperscript{*1} Mor; mortality, Rep; reproduction. Imm; Immobilisation

4.2 Initial Assessment for the Environment

For the environment, various NOEC and LC\textsubscript{50} values were gained from test results; LC\textsubscript{50} $> 1000$ mg/l (acute fish); EC\textsubscript{50} = 250 mg/l (acute daphnia); EC\textsubscript{50} = 6.5 mg/l (acute algae, biomass); 72h NOEC = 3.1 mg/l (algae, biomass method); NOEC = 0.78 mg/l (long-term daphnia reproduction). Therefore, the chemical is considered to be moderately toxic to daphnids and algae. The lowest chronic toxicity result is the 21 d-NOEC (reproduction) for Daphnia magna (0.78 mg/l). An assessment factor of 100 is applied. Thus the PNEC of the chemical is 0.0078 mg/l. Since the PEC is lower than the PNEC, the environmental risk is presumably low.
5 RECOMMENDATIONS

In conclusion, no further testing is needed at present considering its toxicity and exposure levels.

The chemical is considered of low potential risk and low priority for further work.

### 3.1 STABILITY

#### 3.1.1 PHOTODEGRADATION

| Type: | Air [ ]; Water [X]; Soil [ ]; Other [ ] |
| Light source: | Sun light [X]; Xenon lamp [ ]; Other [ ] |
| Light spectrum: |
| Relative intensity: |
| Spectrum of substance: | \( \varepsilon = 18200 \text{ at } 300 \text{ nm} \) |
| | \( \varepsilon = 17100 \text{ at } 600 \text{ nm} \) |

Concentration of Substance:
- Estimated parameter for calculation:
  - Quantum yield: 0.0001
  - Concentration: \( 5 \times 10^{-5} \text{ M} \)
  - Depth of water body: 500 cm
  - Conversion rate: \( 6.023 \times 10^{20} \)

Results:
- Degradation rate: \( 9.78 \times 10^{-12} \text{ mol/l/s} \)
- Half life: 0.112 years

Reference: Lyman, W. J. et al. (1981)

#### 3.1.2 STABILITY IN WATER

| Type: | Abiotic (hydrolysis) [X]; biotic (sediment) [ ] |
| Half life: | 622 days at pH 4 at 25 °C |
| Method: | OECD Test Guideline 111 |
| GLP: | Yes [X]; No [ ]; ? [ ] |
| Remarks: | None |
| Reference: | MITI, Japan (1993) |

#### 3.1.3 STABILITY IN SOIL

No studies located

### 3.2 MONITORING DATA (ENVIRONMENT)

No studies located

### 3.3 TRANSPORT AND DISTRIBUTION BETWEEN ENVIRONMENTAL COMPARTMENTS INCLUDING ESTIMATED ENVIRONMENTAL CONCENTRATIONS AND DISTRIBUTION PATHWAYS

#### 3.3.1 TRANSPORT

No studies located

#### 3.3.2 THEORETICAL DISTRIBUTION (FUGACITY CALCULATION)

| Media: | Air-biota [ ]; Air-biota-sediment-soil-water [ ]; Soil-biota [ ]; Water-air [ ]; Water-biota [ ]; Water-soil [ ]; Other [X] (Air-soil-water-sediment) |
| Method: | Fugacity level I [ ]; Fugacity level II [ ]; Fugacity level III [X]; Fugacity level IV [ ]; Other(calculation) [ ]; Other(measurement) [ ] |

Results:
- Steady state mass and concentration calculated using MNSEM 147S
  - Air: \( 7.7E-12 \text{ [mg/l]} \)
Water: 2.6E-04 [mg/l]
Soil: 5.1E-04 [mg/kg dry solid]
Sediment: 2.2E-02 [mg/kg dry solid]

Exposure dose
- Inhalation of air: 1.4E-07 [mg/day]
- Drinking water: 5.2E-04 [mg/day]
- Ingestion of fish: 1.3E-03 [mg/day]
  - meat: 3.7E-09 [mg/day]
  - milk: 4.5E-09 [mg/day]
  - vegetation: 4.1E-05 [mg/day]
- Total exposure dose: 1.9E-03 [mg/day]

Remarks: Input data:
- Molecular weight: 262.27
- Water solubility: 7.50 [mg/l]
- Vapor pressure: 3.0E-07 [mmHg]
- Log Pow: 2.70

MNSEM 147S is a slightly revised version of MNSEM 145I.
- addition of air particle compartment to air phase
- execution of calculation on a spreadsheet program

Comparison of calculated environmental concentration using several methods (Japanese environmental conditions are applied to the calculations.)

Test substance: Indigo Blue
Remarks:

(c) Type: LD$_0$ [ ]; LD$_{100}$ [ ]; LD$_{50}$ [X]; LDL$_0$ [ ]; Other [ ]
Species/strain: Dog
Value: > 1,000 (mg/kg)
Method:
GLP: Yes [ ] No [ ] ? [X]
Test substance: Indigo Blue
Remarks: Unknown

5.1.2 ACUTE INHALATION TOXICITY

(a) Type: LD$_0$ [X]; LD$_{100}$ [ ]; LD$_{50}$ [ ]; LDL$_0$ [ ]; Other [ ]
Species/strain: Rat (SD)
Value: > 20% (0.08 mg/l)/4hrs
Method:
GLP: Yes [ ] No [ ] ? [X]
Test substance: Comments:

(b) Type: LD$_0$ [X]; LD$_{100}$ [ ]; LD$_{50}$ [ ]; LDL$_0$ [ ]; Other [ ]
Species/strain: Rat
Value: 5.3 mg/l/4hrs
Method:
GLP: Yes [ ] No [ ] ? [X]
Test substance: Comments:
Reference: Unpublished company data
5.1.3 ACUTE DERMAL TOXICITY

Type: LD₀ [ ]; LD₁₀₀ [ ]; LD₅₀ [X]; LD₅₀ [ ]; Other [ ]
Species/strain: Rabbit/New Zealand White
Value: > 20% (2000 mg/kg)
Method: GLP: Yes [ ] No [ ] ? [X]
Test substance:

5.1.4 ACUTE TOXICITY, OTHER ROUTES OF ADMINISTRATION

No studies located

5.2 CORROSIVENESS/IRRITATION

5.2.1 SKIN IRRITATION/CORROSION

(a)
Species/strain: Rabbit
Results: Highly corrosive [ ]; Corrosive [ ]; Highly irritating [ ]; Irritating [ ]; Moderate irritating [ ]; Slightly irritating [ ]; Not irritating [X]
Classification: Highly corrosive (causes severe burns) [ ]; Corrosive (caused burns) [ ]; Irritating [ ]; Not irritating [ ]
Method: GLP: Yes [ ] No [ ] ? [X]
Test substance:
Remarks:
Reference: Unpublished company data

(b)
Species/strain: Rabbit
Results: Highly corrosive [ ]; Corrosive [ ]; Highly irritating [ ]; Irritating [ ]; Moderate irritating [ ]; Slightly irritating [ ]; Not irritating [X]
Classification: Highly corrosive (causes severe burns) [ ]; Corrosive (caused burns) [ ]; Irritating [ ]; Not irritating [ ]
Method: OECD test Guideline
GLP: Yes [ ] No [ ] ? [X]
Test substance: Indigo liquid 20 %
Remarks:
Reference: Unpublished company data

5.2.2 EYE IRRITATION/CORROSION

Species/strain: Rabbit
Results: Highly corrosive [ ]; Corrosive [ ]; Highly irritating [ ]; Irritating [ ]; Moderate irritating [ ]; Slightly irritating [ ]; Not irritating [X]
Classification: Highly corrosive (causes severe burns) [ ]; Corrosive (caused burns) [ ]; Irritating [ ]; Not irritating [ ]
Method: BASF method
GLP: Yes [ ] No [ ] ? [ ]
Test substance:
5.3 SKIN SENSITISATION

Type: Patch-Test
Species/strain: Human
Results: Sensitizing [ ]; Not sensitizing [X]; ambiguous [ ]
Classification: Sensitizing [ ]; Not sensitizing [X]
Method: GLP: Yes [ ]; No [ ]; ? [ ]
Test substance: Reference: Unpublished company data

5.4 REPEATED DOSE TOXICITY

(a)
Species/strain: Rat (albino)
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]
Route of Administration: oral (Diet)
Exposure period: 2 years
Frequency of treatment: Post exposure observation period:
Dose: 0, 0.25, 1.0 or 3.0 % (0, 100, 400, 1200 mg/kg/day)
(25 animals/group)
Control group: Yes [X]; No [ ]; No data [ ];
Concurrent no treatment [ ]; Concurrent vehicle [X]; Historical [ ]
(80 males and 80 females)
NOEL: LOEL: Results: Appearance and behavior of the test rats were generally comparable to those of the controls. At the 3% level, food consumption was significant lower than controls for the first six months but comparable to controls during the remainder of the study. No significant difference in survival rats were noted. Significantly lower hematocrit and hemoglobin values in comparison with controls were obtained at all time intervals except 24 months for the males fed 3%. No such effect was noted in the females. Bilirubinuria was observed at 24 months in male and female at 1% and females at 3%. The test animals sacrificed at 52 weeks did not present any gross changes in the organs or viscera attributable to the test material. Autopsies performed on the animals which died during the second year of the study did not reveal any consistent gross changes. Microscopic findings at two years revealed no compound related effects on the kidneys or other tissues in either sex. The study appeared to demonstrate that after a period of adjustment to the higher dosage levels, the rats were able to tolerate up to 3% of this substance in their diets without serious effects.

Method: GLP: Yes [ ]; No [ ]; ? [X]
5. TOXICITY

(b) Species/strain: Dog (beagle)
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]
Route of Administration: oral (Diet)
Exposure period: 2 years
Frequency of treatment:
Post exposure observation period:
Dose: 0, 0.25, 1.0 or 3.0 % (3 animals/group)
Control group: Yes [X]; No [ ]; No data [ ];
Concurrent no treatment [ ]; Concurrent vehicle [X]; Historical [ ]
NOEL:
LOEL:
Results: No changes in appearance, behavior or elimination were deemed to be compound related and none were dose dependent. Most of the dogs maintained or gained body weight. Lost weights were not dose dependent. Clinical results were within normal limits. Scattered abnormal gross pathological findings did not appear to be compound related and organ weights were not significantly different from those of controls. No histological alterations were found beyond those disease processes usually found in laboratory dogs.
Method:
GLP: Yes [ ] No [ ] ? [X]

(c) Species/strain: Rabbit
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]
Route of Administration: Dermal
Exposure period: 13 weeks
Frequency of treatment: 5 days/week
Post exposure observation period:
Dose: 0, 500 mg/kg/day (1 - 4 animals/group)
Control group: Yes [X]; No [ ]; No data [ ];
Concurrent no treatment [ ]; Concurrent vehicle [X]; Historical [ ]
NOEL:
LOEL:
Results: Weight trends, mortality and signs of systemic toxicity and dermal irritation were recorded. Blood counts and urinalysis were performed on all animals at the start and termination of the study. Additional samples were taken during the fourth weeks from those animals tested for 13 weeks (64 applications). All animals were subjected at autopsy or death or terminal sacrifice. Tissues examined microscopically were: brain, thyroid, lung, heart, liver, kidneys, adrenal, skin and bone marrow.
No effects on any of the examined tissues, or outward signs (mortality, skin conditions) could be ascribes to the test compound.
Method:
GLP: Yes [ ] No [ ] ? [X]

5.5 GENETIC TOXICITY IN VITRO

A. BACTERIAL TEST
OECD SIDS
5. TOXICITY
ID: 482-89-3

(a)
Type: Bacterial reverse mutation assay
System of testing: S. typhimurium TA 98, TA 100, TA 1535, TA 1537, TA 1538
Species/strain: S. typhimurium TA 98, TA 100, TA 1535, TA 1537, TA 1538
Concentration: With [ ]; Without [ ]; With and Without [X]; No data [ ]
Results: Cytotoxicity conc: With metabolic activation:
Precipitation conc: + ? -
Genotoxic effects: With metabolic activation: [ ] [ ] [X]
Without metabolic activation: [ ] [ ] [X]
Method: Yes [ ] No [ ] ? [X]
Reference: Carcinogenesis (1982)
Muzzall, J.M. and Cook, W.L. (1979)

(b)
Type: Bacterial reverse mutation assay
System of testing: S. typhimurium TA 98
Species/strain: S. typhimurium TA 98
Concentration: With [ ]; Without [ ]; With and Without [X]; No data [ ]
Results: Cytotoxicity conc: With metabolic activation:
Precipitation conc: + ? -
Genotoxic effects: Positive
Method: Yes [ ] No [ ] ? [X]
Reference: No high purified substance
Remarks: Unpublished company data

B. NON-BACTERIAL IN VITRO TEST

Type: Cytogenetics Assay
System of testing: Species/strain: Chinese hamster CHL cells
Concentration: Incubated with 0, 124, 500, 1000 or 2500 µg/plate
Metabolic activation: With [ ]; Without [ ]; With and Without [X]; No data [ ]
Results: Cytotoxicity conc: With metabolic activation:
Precipitation conc: not stated
Genotoxic effects: + ? -
With metabolic activation: [X] [ ] [ ]
Without metabolic activation: [X] [ ] [ ]
Method: Japanese Guideline for Screening Mutagenicity testing of chemicals
GLP: Yes [X] No [ ] ? [ ]
Test substance: Commercial, purity 97.2 %
Remarks: Plates/test:2
Activation system: S-9 fraction from the liver of Phenobarbital
and 5,6-Benzoflavone induced male SD derived rats with
NADPH-generating system
No. replicates: 1
Indigo Blue. (HPV/IDS Test conducted by MHW, Japan)

5.6 GENETIC TOXICITY IN VIVO

Type: Micronucleus Test
Species/strain: Mouse
Sex: Female [ ]; Male [ ]; Male/Female [ ]; No data [ ]
Route of Administration: oral; Gavage
Exposure period: two times (interval 24 hours)
Doses: 0, 0.1, 0.5, 1.0 and 2.0 mg/kg
Results:
Effect on mitotic index or P/N ratio:
Genotoxic effects: + ? -
[ ] [ ] [X]
Method: The animals were sacrificed at 30 and 54 hours after first
administration. 1,000 Erythrocytes were examined from each
animal. Cyclophosphamide was used as positive control.
GLP: Yes [ ] No [ ] ? [X]
Test substance:
Remarks:
Reference: Unpublished company data

5.7 CARCINOGENICITY

Species/strain: Mouse
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]
Route of Administration: Dermal
Exposure period: 95 weeks
Frequency of treatment: once/week
Postexposure observation period:
Doses: 1 % solution in benzene
Control group: Yes [X]; No [ ]; No data [ ];
Concurrent no treatment [X]; Concurrent vehicle [X]; Historical [X]
Results: No significant increases as compared to the no treatment group were
observed.
Method:
GLP: Yes [ ] No [ ] ? [X]
Test substance:
Remarks: The negative result was not clear because of the effects of unusual
vehicle.
Reference: Unpublished company data

5.8 TOXICITY TO REPRODUCTION

Type: Fertility [ ]; One generation study [ ]; Two generation study [ ];
Other [X] (Three generation study)
Species/strain: Rat (Harlan-Wistar)

**NOEL Maternal Toxicity:**

**NOEL teratogenicity:**

**Results:** On the basis of number of viable and dead fetuses, resorption site, mean fetal weight, sex distribution, mean litter size, frequency of anomalies or weight gain of pregnant females, D&C Blue No. 6 was without effect on reproduction performance, maternal weight gain and fetal development.

**Method:**

**GLP:** Yes [ ] No [ ] ? [X]

**Test substance:**

**Remarks:**

**Reference:** Ferber, K.H. (1987)

**Species/strain:** Rabbit (New Zealand White)
