FOREWORD

INTRODUCTION

BENZENE, 1,4-DICHLORO-2-NITRO

CAS N°: 89-61-2
SIDS Initial Assessment Report

For

SIAM 4

Tokyo, Japan, 20-22 May 1996

1. Chemical Name: Benzene, 1,4-dichloro-2-nitro-

2. CAS Number: 89-61-2

3. Sponsor Country: Japan

National SIDS Contact Point in the Sponsor Country:
Mr. Yasuhisa Kawamura,
Ministry of Foreign Affairs, Japan

4. Shared Partnership with:

5. Roles/Responsibilities of the Partners:
   - Name of industry sponsor /consortium
   - Process used

6. Sponsorship History
   - How was the chemical or category brought into the OECD HPV Chemicals Programme?
     As a high priority chemical for initial assessment, 2,5-dichloronitrobenzene was selected for assessment in the framework of the HPV Programme.

7. Review Process Prior to the SIAM:
   - SIDS Dossier and Testing Plan were reviewed at a SIDS Review Meeting in 1994, where the following SIDS Testing Plan was agreed:
     - no testing [ ]
     - testing [X]
     - Physical Chemical Properties
       - Vapour Pressure
       - Partition Coefficient
       - Water solubility
     - Environmental fate / Biodegradation
       - Photodegradation
       - Stability in water
       - Biodegradation
Ecotoxicity
  Acute toxicity to fish
  Acute toxicity to daphnids
  Acute toxicity to algae
  Chronic toxicity to daphnids

Toxicity
  Reproductive/developmental toxicity
  Gene mutation test
  Chromosomal aberration in vitro

At SIAM-4, the conclusions of the Report were approved with comments. Comments at SIAM-4: The documents should be rearranged. The original report was already circulated in March 1996, and was revised according to the comments from member countries.

8. Quality check process:

9. Date of Submission: 30 April 1996

10. Date of last Update:

11. Comments:
OECD SIDS BENZENE, 1,4-DICHLORO-2-NITRO-

CONCLUSIONS AND RECOMMENDATIONS

A potential hazard to man due to genotoxicity is identified, but exposure is low in the sponsor country. Unless further information on exposure in other Member countries presents evidence to the contrary, it is currently considered of low potential risk and low priority for further work.

SHORT SUMMARY WHICH SUPPORTS THE REASONS FOR THE CONCLUSIONS AND RECOMMENDATIONS

Exposure

The production volume of 2,5-dichloronitrobenzene in Japan was ca. 200 - 1,200 tonnes/year in 1988 – 1992, and 2,400 - 2,800 tonnes/year in Germany. This chemical is used as an intermediate for pigments, pesticides and UV absorbents in closed systems in Japan. This chemical is stable in neutral, acidic or alkaline solutions, and is considered as “not readily biodegradable”.

The potential environmental distribution of the chemical obtained from a generic fugacity model (Mackey level III) showed that the chemical would be distributed mainly to water and soil. The Predicted Environmental Concentration (PEClocal) of this chemical was estimated as 8.0 x 10⁻⁴ mg/l in a Japanese local exposure scenario.

As 2,5-dichloronitrobenzene is produced in a closed system, exposure during synthesis may be excluded. Workers wear personal protective equipment (e.g. a chemical cartridge respirator with an organic vapour cartridge) when filling barrels with the product. Therefore, the exposure in the workplace is considered to be negligible in the present situation. In addition, this chemical is not contained in consumer products, because it is an intermediate in industrial use. For indirect exposure via the environment, the daily intake through drinking water is estimated to be 2.6 x 10⁻⁵ mg/kg/day and through fish is calculated as 1.2 x 10⁻³ mg/kg/day.

Environment

For the environment, various NOEC and LC₅₀ values were gained from test results; 96h-LC₅₀ = 5.4 - 8.5 mg/l (acute fish); 24h-EC₅₀ = 8.0 mg/l (acute daphnia); 72h-EC₅₀ = 5.0 mg/l (acute algae); 72h-NOEC = 2.0 mg/l (algae); 21d-NOEC = 1.0 mg/l (long-term daphnia reproduction). The lowest chronic toxicity result for daphnia [21d-NOEC (reproduction) of *Daphnia magna* (1.0 mg/l)] was used with an assessment factor of 100 to determine the PNEC according to the OECD Provisional Guidance for Initial Assessment of Aquatic Effects. Thus, the PNEC of the chemical is 0.01 mg/l. The PEC is lower than the PNEC. The environmental risk is presumed to be low.

Human Health

The chemical showed genotoxic effects in the Ames test and the chromosomal aberration test in vitro. In a repeated dose toxicity test, a slight effect to the liver (e.g. increased liver weight) and damage in the reproductive system (e.g. ...
necrosis of germ epithelium, azoospermia) were observed. The NOEL was 10 mg/kg/day. In a preliminary reproductive/developmental screening toxicity test, one dam, receiving 60 mg/kg/day, delivered dead pups. In the highest dose group (200 mg/kg/day), one dam died on day 20 of the pregnancy, one during the delivery period and four during the lactation period. A lack of care behaviour was also found in dams at the highest dose level. At that level, many pups died during the lactation period and a reduced body weight of the pups was observed. In this study, suppression of body weight gains and food consumption and an effect to the testes were also observed in adult rats at the highest dose. The NOEL for reproductive toxicity was 20 mg/kg/day.

For human health, the NOEL is estimated as 10 mg/kg/day for repeated dose and 20 mg/kg/day for reproductive toxicity. As for indirect exposure via the environment, the PEC was estimated as $8.0 \times 10^{-4}$ mg/l in a local exposure scenario. The daily intake through drinking water is estimated as $2.6 \times 10^{-5}$ mg/kg/day and through fish is calculated as $1.2 \times 10^{-3}$ mg/kg/day. The margin of safety is large. Therefore, the health risk through the environment, in general, is considered to be low due to its use pattern and exposure.

In conclusion, no further testing is needed at present considering its toxicity and exposure levels.

**NATURE OF FURTHER WORK RECOMMENDED**

2 GENERAL INFORMATION ON EXPOSURE

2.1 Production Volumes and Use Pattern

The production volume of 2,5-dichloronitrobenzene in Japan was ca. 200 - 1,200 tonnes/year in 1988 - 1992. The majority of this amount was sold and handled in Japan. This chemical is used as an intermediate for pigments, pesticides and UV absorbents in closed systems in Japan. This chemical is stable in neutral, acidic or alkaline solutions, and is considered to be “not readily biodegradable”. Direct photodegradation is expected because 2,5-dichloronitrobenzene absorbs UV light. The half-life is estimated to be about a week.

2.2 Environmental Exposure and Fate

2.2.1 Sources of Environmental Exposure

The potential environmental distribution of 2,5-dichloronitrobenzene obtained from a generic level III fugacity model is shown in Table 2. The results show that if 2,5-dichloronitrobenzene is released mainly to water and soil, it is unlikely to distribute into other compartments. But, if 2,5-dichloronitrobenzene is released mainly to air, it is likely to be transported both to water and soil.

Local exposure

According to a Japanese manufacturer, 8000 kg/year (estimated) of 2,5-dichloronitrobenzene are released with 1.0 x 10^7 t/y of effluent into a bay. The local predicted environmental concentration (PEC_local) is 8.0 x 10^{-4} mg/l, employing the following calculation model. In this case, the dilution factor is estimated to be 1000.

Amount of release (8.0 x 10^9 mg/y)

Volume of effluent (1.0 x 10^{10} l/y) x Dilution factor (1000)

2.3 Human Exposure

The highest exposure to the general population via the environment would be expected through drinking water processed from surface water. Based on the physical chemical properties of 2,5-dichloronitrobenzene, a significant removal during processing is not expected. Although PEC_global cannot be estimated, the concentration in drinking water is assumed to be 8.0 x 10^{-4} mg/l, as the worst case.
2.3.1 Occupational Exposure

As 2,5-dichloronitrobenzene is produced in a closed system, exposure during synthesis may be excluded. This chemical is used as an intermediate for pigments, pesticides and UV absorbents. Workplace exposure is possible when the product is filled into barrels, with inhalation uptake considered to be the main exposure route. Skin contact plays a minor role. Workers wear a chemical cartridge respirator with an organic vapour cartridge during the filling process. Therefore, the exposure to workers is estimated to be negligibly small in the present situation.

2.3.2 Consumer Exposure

2,5-Dichloronitrobenzene is not contained in consumer products because this substance is used as an intermediate for pigments, pesticides and UV absorbents. No further information on consumer use is available.
3 HUMAN HEALTH HAZARDS

3.1 Effects on Human Health

3.1.1 Acute Toxicity

Oral and dermal LD$_{50}$ values of 2,5-dichloronitrobenzene for male rats was reported to be 2,503 mg/kg and > 2,000 mg/kg, respectively.

3.1.2 Irritation

Two reports on irritation tests are available. The results were that 2,5-dichloronitrobenzene was not irritating to the skin and eyes of rabbits.

3.1.3 Repeated Dose Toxicity

An Oral 28-Days repeated dose study of 2,5-Dichloronitrobenzene in Wistar rats at doses of 0, 10, 50, 250 mg/kg/day was reported (Hoechst AG, 1990). Impairment of body weight gain, increased hepatic weight and bilirubin value, and damaging of the forestomach were observed in the 50 mg/kg or more groups. The high dose group showed distinct increases of water consumption and clinical symptoms (salivation, crouching position, crural walk). Also, hepatocellular hypertrophy and testicle damage (necrosis of germ epithelium, azoospermic, depression of spermatogenesis) were observed in the high dose group. The NOEL for 28 days repeated dose toxicity was considered to be 10 mg/kg/day from this study.

3.1.4 Mutagenicity

In vitro Studies

Bacterial test

A reverse gene mutation assay was conducted in line with Guidelines for Screening Mutagenicity Testing of Chemicals (Japan) and OECD Test Guidelines 471 and 472, using the pre-incubation method. This study was well controlled and regarded as a key study. Although 2,5-dichloronitrobenzene showed positive results in $S$. typhimurium TA 100 with and without metabolic activation and TA 1535 without metabolic activation, negative results were obtained in TA98, TA 1537 and $Escherichia$ coli WP2 uvrA with and without metabolic activation at concentrations up to 5 mg/plate (MHW, 1994b).

Non-bacterial test in vitro

A chromosomal aberration test in line with the Guidelines for Screening Mutagenicity Testing of Chemicals (Japan) and the OECD Test Guideline 473 was conducted using cultured Chinese Hamster lung (CHL/IU) cells. This study was well controlled and regarded as a key study. The maximum concentration of the chemical was used with no apparent cytotoxic effect in continuous treatment. The chemical showed positive results in Chinese hamster CHL cells without metabolic activation. (MHW, 1994b).

In vivo Studies

No data are available on in vivo mutagenicity tests.
3.1.5 Toxicity for Reproduction

2,5-Dichloronitrobenzene was studied for its oral toxicity in rats in an OECD preliminary reproductive toxicity test at doses of 0, 6, 20, 60, 200 mg/kg/day (MHW, 1994a). One dam receiving 60 mg/kg delivered only dead pups. In the 200 mg/kg group, one dam died on day 20 of pregnancy, one during the delivery period and four during the lactation period. A lack of care behaviour was also found in seven dams receiving 200 mg/kg. A lower value for the viability index on day 4 of lactation was obtained with 200 mg/kg because many pups died during the lactation period. With the pups of the 200 mg/kg group, reduced body weight values were obtained for both sexes on day 0 and 4 of lactation. It is concluded that the chemical exerts effects on dams during the perinatal period at 60 mg/kg or more and the dams during the lactation period at 200 mg/kg. In addition, there are indications that the chemical affects growth of new born pups at 200 mg/kg.

Regarding repeated dose toxicity, the chemical exhibited influence on general signs (yellowish urine and salivation at 60 mg/kg or more, and perigenital soiling, decrease in locomoter activity and extension of the hind limbs at 200 mg/kg in both sexes), suppressed body weight gains in both sexes at 200 mg/kg, and lower values for food consumption in females at 200 mg/kg. Degeneration of seminiferous epithelium in the testes and debris in ducts of the epididymides were found at 200 mg/kg. Atrophy of the thymus and decreased cellularity of white pulps in the spleen were found in surviving females, whereas atrophy/hemorrhage in the thymus, lymphoid atrophy and decreased cellularity of the marginal zone in the spleen, congestion in the lungs and liver, and glandular stomach ulcers were found in females receiving 200 mg/kg which died. The NOEL for reproductive toxicity was considered to be 200 mg/kg/day and 20 mg/kg/day for reproductive performance of male and females, respectively, and 60 mg/kg/day for development of pups.

3.2 Initial Assessment for Human Health

2,5-Dichloronitrobenzene showed genotoxic effects in the Ames test and the chromosomal aberration test in vitro using CHL cells. The NOEL is estimated to be 10 mg/kg/day for repeated dose toxicity and 20 mg/kg/day for reproductive toxicity. As for indirect exposure via the environment, the PEC was estimated to be 8.0 x 10^{-4} mg/l in a local exposure scenario. The daily intake through drinking water is estimated to be 2.6 x 10^{-3} mg/kg/day and through fish is calculated as 1.2 x 10^{-3} mg/kg/day. The margin of safety is large. Therefore, the health risk through the environment, in general, is considered to be low due to its use pattern and exposure.
4 HAZARDS TO THE ENVIRONMENT

4.1 Aquatic Effects

Acute and Chronic Toxicity Test Results

2,5-Dichloronitrobenzene has been tested in a limited number of aquatic species (*Selenastrum capricornutum*, *Daphnia magna* and *Oryzias latipes*) according to OECD test guidelines [OECD TG 201, 202 (part I and II), and 203]. Acute and chronic toxicity data to test organisms for the chemical are summarized in Table 3. No other ecotoxicological data are available. Various NOEC and LC50 values were gained from the above tests; LC50 (96h) = 5.4 mg/l (acute fish); EC50 (24h) = 8.0 mg/l (acute daphnia); EC50 (72h) = 5.0 mg/l (acute algae); NOEC (72h) = 2.0 mg/l; EC50 (21d) = 2.5 mg/l (long-term daphnia reproduction); NOEC (21d) = 1.0 mg/l. Therefore, the chemical is considered to be moderately toxic to, fish, daphnids and algae. The lowest chronic toxicity result [21d-NOEC (reproduction) of *Daphnia magna* (1.0 mg/l)] was used with an assessment factor of 100 to determine the PNEC according to the OECD Provisional Guidance for Initial Assessment of Aquatic Effects. Thus, the PNEC of the chemical is 0.01 mg/l. The PEC is lower than the PNEC. The environmental risk is presumed to be low.

Notes: *1 Mor = mortality; Rep = reproduction.

4.2 Initial Assessment for the Environment

Various NOEC and LC50 values were gained from test results; LC50 = 5.4 - 8.5 mg/l (acute fish); EC50 = 8.0 mg/l (acute daphnia); EC50 = 5.0 mg/l (acute algae); NOEC = 2.0 mg/l (acute algae); NOEC = 1.0 mg/l (long-term daphnia reproduction). The lowest chronic toxicity result [21d-NOEC (reproduction) of *Daphnia magna* (1.0 mg/l)] was used with an assessment factor of 100 to determine the PNEC according to the OECD Provisional Guidance for Initial Assessment of Aquatic Effects. Thus, the PNEC of the chemical is 0.01 mg/l. The PEC is lower than the PNEC. The environmental risk is presumed to be low.
5 RECOMMENDATIONS

The chemical is currently of low priority for further work.

A potential hazard to man due to genotoxicity is identified, but exposure is low in the sponsor country.

Unless further information on exposure in other Member countries presents evidence to the contrary, it is currently considered of low potential risk and low priority for further work.

BENZENE, 1,4-DICHLORO-2-NITRO-
OECD SIDS  BENZENE, 1,4-DICHLORO-2-NITRO-

1. GENERAL INFORMATION

1.01 SUBSTANCE INFORMATION

A. CAS-Number  89-61-2
B. Name (IUPAC name)  1,4-Dichloro-2-nitrobenzene
C. Name (OECD name)  Benzene, 1,4-dichloro-2-nitro
D. CAS Descriptor  Not applicable
E. EINECS-Number  201-923-3
F. Molecular Formula  \( \text{C}_3\text{H}_9\text{Cl}_2\text{NO}_2 \)
G. Structural Formula

\[
\begin{array}{c}
\text{Cl} \\
\text{NO}_2 \\
\text{Cl}
\end{array}
\]

H. Substance Group  Not applicable
I. Substance Remark  None
J. Molecular Weight  192.00

1.02 OECD INFORMATION

A. Sponsor Country:  Japan
B. Lead Organisation:
   Name of Lead Organisation:  Ministry of Health and Welfare (MHW)  
   Ministry of International Trade and Industry (MITI)  
   Environment Agency (EA)
   Contact person:  Mr. Yasuhisa Kawamura  
   Director  
   Second International Organization Bureau  
   Ministry of Foreign Affairs
   Address:  2-2-1 Kasumigaseki, Chiyoda-ku  
   Tokyo 100, Japan

2. PHYSICO-CHEMICAL DATA ID: 89-61-2

B. pH Value, pKa Value

Value:          pH 6.9 (80 mg/l water)
Temperature:   20 °C
Method:        Unknown
GLP:           Yes [ ] No [ ] ? [X]
Reference:     Company (Hoechst) data (1991)

2.7 FLASH POINT

No data available

2.8 AUTO FLAMMABILITY

No data available

2.9 FLAMMABILITY

No data available

2.10 EXPLOSIVE PROPERTIES

No data available

2.11 OXIDIZING PROPERTIES

No data available

2.12 OXIDATION: REDUCTION POTENTIAL

No data available

2.13 ADDITIONAL DATA

A. Partition co-efficient between soil/sediment and water (Kd)

No data available

B. Other data

None
3. ENVIRONMENTAL FATE AND PATHWAYS

3.1 STABILITY

3.1.1 PHOTODEGRADATION

Type: Air [ ]; Water [X]; Soil; Other [ ]
Light source: Sunlight [X]; Xenon lamp [ ]; Other [ ]
Spectrum of substance: \( \varepsilon = 1.26 \times 10^{-3} \) at 300 nm
Estimated parameter for calculation:
- Quantum yield 0.01
- Concentration 5 \( \times \) 10^{-5} M
- Depth of water body 500 cm
- Conversion constant 6.023 \( \times \) 10^{20}

Result:
- Degradation rate 1.18 \( \times \) 10^{-11} mol / l / s
- Half life 9.32 \( \times \) 10^{-2} years

Reference:

3.1.2 STABILITY IN WATER

Type: Abiotic (hydrolysis) [X]; biotic (sediment)[ ]
Result: Stable at pH 4, 7 and 9 at 25 °C
Method: OECD Test guideline 111
GLP: Yes [X]. No [ ] ? [ ]
Test substance: 2,5-Dichloronitrobenzene
Reference: MITI, Japan (1994b)

3.1.3 STABILITY IN SOIL

No data available

3.2 MONITORING DATA (ENVIRONMENT)

(a)
Type of Measurement: Background [ ], At contaminated Site [ ], Other [X]
Media: Surface water
Results: ND (Detection limits:0.02 ug/ml) in 21 areas in Japan as of 1982
Remarks: None
Reference: EA, Japan (1985)

(b)
Type of Measurement: Background [ ], At contaminated Site [ ], Other [ ]
Media: Sediment
Results: ND (Detection limits: 0.001 ug/ml) in 21 areas in Japan as of 1982
Remarks: None
Reference: EA, Japan (1985)

3.3 TRANSPORT AND DISTRIBUTION BETWEEN ENVIRONMENTAL COMPARTMENTS INCLUDING ESTIMATED ENVIRONMENTAL CONCENTRATIONS AND DISTRIBUTION PATHWAYS
3.3.1 TRANSPORT

No data available

3.3.2 THEORETICAL DISTRIBUTION (FUGACITY CALCULATION)

The potential environmental distribution of 2,5-dichloronitrobenzene obtained from a generic level III fugacity model is shown in Table. The results show that if 2,5-dichloronitrobenzene is released mainly to water or soil, it is unlikely to distribute into other compartments. But, if 2,5-dichloronitrobenzene is released mainly to air, it is likely to be transported both to water and soil.

Environmental distribution of 2,5-dichloronitrobenzene using a generic level III fugacity model.

3.4 IDENTIFICATION OF MAIN MODE OF DEGRADABILITY IN ACTUAL USE

No data available

3.5 BIODEGRADATION

Type: aerobic [X]; anaerobic [ ]
Inoculum: adapted [ ]; non-adapted [X];
Concentration of the chemical: 100 mg/l related to Test Substance [X]
Medium: water [ ]; water-sediment [ ]; soil [ ]; sewage treatment [ ]
other [Japanese standard activated sludge]
Degradation: Degree of degradation after 28 days
8, 4 and 0 % from BOD
0.1, and 1 % from HPLC analysis
Results: Readily biodeg. [ ]; Inherently biodeg. [ ]; under test condition no biodegradation observed [X]
Method: OECD Test Guideline 301 C
GLP: Yes [X] No [ ]
Test substance: 2,5-Dichloronitrobenzene
Reference: MITI (1994b)

3.6 BOD5, COD OR RATIO BOD5/COD

Not applicable

3.7 BIOACCUMULATION

Species: Guppy
**Exposure period:**
- **Temperature:** 21-23 °C
- **Concentration:** 1 mg/l
- **BCF:** 820

**Method:**
- **Type of test:** calculated [ ]; measured [X]
- **GLP:** Yes [ ] No [ ] ? [X]

**Test substance:** Purity 98 %

### 3.8 ADDITIONAL REMARKS

A. **Sewage treatment**
   - None

B. **Other information**
   - None
4. ECOTOXICOLOGICAL DATA

4.1 ACUTE/PROLONGED TOXICITY TO FISH

Type of test: static [ ]; semi-static [X]; flow-through [ ]; other [ ]
open-system [ ]; closed-system [X]

Species: *Oryzias latipes*

Exposure period: 96 hrs

Results:
- LC$_{50}$ (24h) = 8.5 mg/l (95% confidence limits: 7.2-10 mg/l)
- LC$_{50}$ (48h) = 8.2 mg/l (95% confidence limits: 6.8-9.8 mg/l)
- LC$_{50}$ (72h) = 7.0 mg/l (95% confidence limits: 5.1-10 mg/l)
- LC$_{50}$ (96h) = 5.4 mg/l (95% confidence limits: 4.5-6.6 mg/l)

NOEC = mg/l

LOEC = mg/l

Analytical monitoring: Yes [ ] No [X] ? [ ]

GLP: Yes [ ] No [X] ? [ ]

Test substance: 1,4-Dichloro-2-nitrobenzene, purity = 98 %

Remarks: A group of 10 fish were exposed to each of 5 nominal concentrations (3.0-15 mg/l). Stock solution was prepared with Tween 80:acetone = 1:1 (100 mg/l). Controls with and without this vehicle were taken for the test. The vessel was sealed with a Parafilm.

Reference: EA, Japan (1994)

4.2 ACUTE TOXICITY TO AQUATIC INVERTEBRATES

A. Daphnia

Type of test: static [X]; semi-static [ ]; flow-through [ ]; other [ ];
open-system [X]; closed-system [ ]

Species: *Daphnia magna*

Exposure period: 24 hr

Results:
- EC$_{50}$ (24h) = 8.0 mg/l (95% confidence limits:6.1-11 mg/l)

Analytical monitoring: Yes [ ] No [X] ? [ ]

GLP: Yes [ ] No [X] ? [ ]

Test substance: 1,4-Dichloro-2-nitrobenzene, purity = 98 %

Remarks: 20 daphnids (4 replicates; 5 organisms per replicate) were exposed to each of 7 nominal concentrations (1.0-32 mg/l). Stock solution was prepared with DMSO:HCO = 9:1 (1000 mg/l). Controls with and without this vehicle were taken for the test.

Reference: EA, Japan (1994)

B. Other aquatic organisms

No data available

4.3 TOXICITY TO AQUATIC PLANTS e.g. Algae

Species: *Selenastrum capricornutum* ATCC 22662

End-point: Biomass [X]; Growth rate [ ]; Other [ ]

Exposure period: 72 hours

Results:
- Biomass: EC$_{50}$ (72h) = 5.0 mg/l
  NOEC = 2.0 mg/l (p<0.05)
  LOEC =

Analytical monitoring: Yes [ ] No [X] ? [ ]

Method: open-system [X]; closed-system [ ]

OECD Test Guideline 201 (1984)
4.4 TOXICITY TO BACTERIA

No studies located

4.5 CHRONIC TOXICITY TO AQUATIC ORGANISMS

4.5.1. CHRONIC TOXICITY TO FISH

Test species: *Poecilia reticulata* (guppy)

Test method:
Type of test: static [], semi-static [], flow-through []
Other (e.g., field test) [X]

GLP: Yes [ ] No [ ] ? [X]

Test results:
LC₅₀: 4.9 mg/l

Test substance: purity: 98%

Remarks:

4.5.2. CHRONIC TOXICITY TO AQUATIC INVERTEBRATES

Type of test: static []; semi-static [X]; flow-through [ ]; other [ ]; open-system [X]; closed-system [ ]

Species: *Daphnia magna*

End-point: Mortality [ ]; Reproduction rate [X]; Other [X]

Exposure period: 21 day

Results:
Immobilization: LC₅₀ (48 h) = 17 mg/l (95% confidence limits: 12-66 mg/l)
LC₅₀ (21 d) = 2.3 mg/l (95% confidence level: 730-860 mg/l)
NOEC =
LOEC =

Reproduction: EC₅₀ (21 d) = 2.5 mg/l (95% confidence level: 2.1-3.1 mg/l)
NOEC = 1.0 mg/l (p < 0.05)
LOEC = 3.2 mg/l (p < 0.05)

Analytical monitoring: Yes [ ] No [X] ? [ ]

GLP: Yes [ ] No [X] ? [ ]

Test substance: 1,4-Dichloro-2-nitrobenzene, purity = 98%

Remarks:
40 daphnids (4 replicates; 10 organisms per replicate) were exposed to each of 5 nominal concentrations (0.10-10 mg/l).
Stock solution was prepared with DMSO:HCO-40=9:1 (500 mg/l). Controls with and without this vehicle were taken for the test.

Reference: EA, Japan (1994)

4.6 TOXICITY TO TERRESTRIAL ORGANISMS

4.6.1 TOXICITY TO SOIL DWELLING ORGANISMS

No data available
4.6.2 TOXICITY TO TERRESTRIAL PLANTS

No data available

4.6.3 TOXICITY TO OTHER NON MAMMALIAN TERRESTRIAL SPECIES (INCLUDING AVIAN)

No data available

4.7 BIOLOGICAL EFFECTS MONITORING (INCLUDING BIOMAGNIFICATION)

No studies located

4.8 BIOTRANSFORMATION AND KINETICS IN ENVIRONMENTAL SPECIES

No data available

4.9 ADDITIONAL REMARKS

None
5. TOXICITY

5.1 ACUTE TOXICITY

5.1.1 ACUTE ORAL TOXICITY

(a)
Type: LD₀ [ ]; LD₁₀₀ [ ]; LD₅₀ [X ]; LDL₀ [ ]; Other [ ]
Species/strain: Rat
Value: 2,503 mg/kg
Method: Unknown
GLP: Yes [ ] No [ ] ? [X]
Test substance: purity: Unknown
Remarks: None
Reference: Company data (Hoechst AG)

5.1.2 ACUTE INHALATION TOXICITY

No data available

5.1.3 ACUTE DERMAL TOXICITY

Type: LD₀ [ ]; LD₁₀₀ [ ]; LD₅₀ [X ]; LDL₀ [ ]; Other [ ]
Species/strain: Rat
Value: > 2,000 mg/kg
Method: Unknown
GLP: Yes [ ] No [ ] ? [X]
Test substance: purity: Unknown
Remarks: None
Reference: Company data (Hoechst AG, 1988)

5.1.4 ACUTE TOXICITY, OTHER ROUTES OF ADMINISTRATION

No data available

5.2 CORROSIVENESS/IRRITATION

5.2.1 SKIN IRRITATION/CORROSION

(a)
Species/strain: Rabbit
Method: Barail-test
GLP: Yes [ ] No [ ] ? [X]
Results: No irritation
Test substance: purity: Unknown
Remarks: None
Reference: Company data (Hoechst AG, 1968)

(b)
Species/strain: Rabbit
Method: Patch-test, semi-okkulusive
GLP: Yes [ ] No [ ] ? [X]
Results: No irritation
Test substance: purity: Unknown
Remarks: None
Reference: Company data (Hoechst AG, 1989)
5.2.2 EYE IRRITATION/CORROSION

(a)  
Species/strain: Rabbit  
Method:  
GLP: Yes [X] No [ ] ? [ ]  
Results: No irritation  
Test substance: purity: Unknown  
Remarks: None  
Reference: Company data (Hoechst AG, 1968)

(b)  
Species/strain: Rabbit  
Method: Standard Draized method  
GLP: Yes [X] No [ ] ? [ ]  
Results: 100 mg/24 h Moderate  
Test substance: purity: Unknown  
Remarks: None  
Reference: RTECS Database

5.3 SKIN SENSITISATION

Species/strain: Guinea Pigs  
Method: Maximization test  
GLP: Yes [X] No [ ] ? [ ]  
Results: No sensitization  
Test substance: purity: Unknown  
Remarks: None  
Reference: Company data (Hoechst AG, 1968)

5.4 REPEATED DOSE TOXICITY

Species/strain: Rat (Wistar)  
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]  
Route of Administration: oral gavage  
Exposure period: 28 days  
Frequency of treatment:  
Post exposure observation period:  
Dose: 0, 10, 50 or 250 mg/kg  
Control group: Yes [X]; No [ ]; No data [ ]; Concurrent no treatment [ ]; Concurrent vehicle [X]; Historical [ ]  
NOEL: 10 mg/kg/day  
LOEL: 50 mg/kg/day  
Results: Impair pf body weight gain, increased hepatic weight and bilirubin value, and damaging of the forestomach were observed in the 50 mg/kg or more groups. High dose group showed distinct increases of water consumption and clinical symptoms (salivation, crouching position, crural walk). Also, hepatocellular hypertrophy and testicle damaging (necrosis of germ epithelium, azoospermia, depression of spermatogenesis) were observed in the high dose group.

Method: not described  
GLP: Yes [X] No [ ]; ? [X]  
Test substance: Commercial, purity: Unknown  
Reference: Company data (Hoechst AG, 1990)
5.5 GENETIC TOXICITY IN VITRO

A. BACTERIAL TEST

Type: Bacterial reverse mutation assay
System of testing:
Species/strain: S. typhimurium TA 98, TA 100, TA 1535, TA1537
E. coli WP2 uvrA
Concentration: 0, 78.13, 156.3, 312.5, 625, 1250, 2500, 5000 µg/plate
Metabolic activation: With [ ]; Without [ ]; With and Without [X]; No data [ ]
Results:
Cytotoxicity conc: With metabolic activation: 1250 µg/plate
Without metabolic activation: 1250 µg/plate
Precipitation conc:
Genotoxic effects:

S. typhimurium TA 100
+ ? -
With metabolic activation: [X] [ ] [ ]
Without metabolic activation: [X] [ ] [ ]

S. typhimurium TA 1535
+ ? -
With metabolic activation: [ ] [ ] [X]
Without metabolic activation: [X] [ ] [ ]

S. typhimurium TA 98 and TA1537
+ ? -
With metabolic activation: [ ] [ ] [X]
Without metabolic activation: [ ] [ ] [X]

E. coli WP2 uvrA
+ ? -
With metabolic activation: [ ] [ ] [X]
Without metabolic activation: [ ] [ ] [X]

Method: Japanese Guideline for Screening Mutagenicity testing of chemicals
GLP: Yes [X] No [ ] ? [ ]
Test substance: Commercial, purity: > 99.5 %
Remarks: Procedure: Plate incorporation method
Plates/test: 3
Activation system: Liver S-9 fraction from Phenobarbital and 5,6-Benzoflavone pretreated male SD rats with NADPH-generating system
Media: Histidine selective
No. replicates: 2
Reference: MHW, Japan (1994)

B. NON-BACTERIAL IN VITRO TEST

Type: Cytogenetics Assay
System of testing:
Species/strain: Chinese hamster lung (CHL/IU) cells
Concentration: -S9 (continuous treatment) 0, 0.04, 0.08, 0.15 mg/ml
-S9 (short-term treatment) 0, 0.024, 0.047, 0.094 mg/ml
+S9 (short-term treatment) 0, 0.024, 0.047, 0.094 mg/ml
Metabolic activation: With [ ]; Without [ ]; With and Without [X]; No data [ ]
Results:
Cytotoxicity conc: With metabolic activation:
5.5 GENETIC TOXICITY IN VIVO

No data available

5.6 CARCINOGENICITY

No data available

5.8 TOXICITY TO REPRODUCTION

Type: Fertility [ ]; One generation study [ ]; Two generation study [ ]; Other [X]
Species/strain: Rat Crj:CD(SD)
Sex: Female [ ]; Male [ ]; Male/Female [X]; No data [ ]
Route of Administration: Oral, gavage
Exposure period: Males: 42 days including 14 days before mating
                Females: from 14 days before mating to day 3 of lactation.
Frequency of treatment: 7 days/week
Postexposure observation period:
Premating exposure period: male: 14 days, female: 14 days
Duration of the test;
Doses: 0, 6, 20, 60 or 200 mg/kg (12 animals/sex/group)
Control group: Yes [X]; No [ ]; No data [ ]; Corn oil
               Concurrent no treatment [ ]; Concurrent vehicle [X];
               Historical [ ]
NOEL Parental: 20 mg/kg/day
NOEL F1 Offspring: 60 mg/kg/day
NOEL F2 Offspring: N/A
Results:
One dam receiving 60 mg/kg delivered only dead pups. In the 200 mg/kg
group, one dam died on Day 20 of pregnancy, one during the delivery period
and four during the lactation period. A lack of care behaviour was also found
in seven dams receiving 200 mg/kg. A lower value for the viability index on
Day 4 of lactation was obtained with 200 mg/kg because many pups died
during the lactation period. With the pups of the 200 mg/kg group, reduced
body weight values were obtained for both sexes on Day 0 and 4 of lactation.
It is concluded that the chemical exerts effects on dams during the perinatal
period at 60 mg/kg or more and the dams during the lactation period at 200
mg/kg. In addition, there are indications that the chemical affects growth
of new born pups at 200 mg/kg. With the repeated dose toxicity, the chemical
exhibited influence on general signs (yellowish urine and salivation at 60
mg/kg or more, and perigenital soiling, decrease in locomotor activity and
extension of the hind limbs at 200 mg/kg in both sexes), suppressed body
weight gains in both sexes at 200 mg/kg, and lower values for food
consumption in females at 200 mg/kg. Degeneration of seminiferous epithelium in the testes and debris in the ducts of the epididymides were found at 200 mg/kg. Atrophy of the thymus and decreased cellularity of white pulps in the spleen were found in surviving females, whereas atrophy/hemorrhage in the thymus, lymphoid atrophy and decreased cellularity of the marginal zone in the spleen, congestion in the lungs and liver, and glandular stomach ulcers were found in females receiving 200 mg/kg which died.

Method: OECD Preliminary Reproductive Toxicity Test (1992)
GLP: Yes [X] No [ ] ? [ ]
Test substance: Purity > 99.5 %
